1. Introduction

This report provides an analytical summary of the crime data dashboard.

It examines trends in reported crimes over time, distribution by crime categories, spatial crime concentration, arrest patterns, and domestic-related incidents.

The aim is to identify meaningful insights that can support decision-making, improve allocation of policing resources, and strengthen community safety strategies.

2. Overview Insights

- A total of more than 7,083,910 crimes were recorded across the period under review.
- Out of these, about 1,833,872 resulted in arrests.
This reflects an overall arrest rate of 26%, indicating that a large proportion of reported crimes did not lead to arrests.
- The dataset spans 540 unique locations, ensuring a wide geographic coverage of the analysis.

3. Trends Over Time

- **Yearly Trends:** Reported crimes reached their highest levels between 2002 and 2005, with over 400,000 cases per year. From 2006 onward, there has been a gradual decline, with annual figures dropping below 210,000 after 2020.

- **Monthly Trends:** Crime levels remain fairly consistent across months, although June to August (summer/holiday period) consistently records slightly higher volumes.
- **Time of Day:** Crime occurrences are most frequent in the afternoon (2.2 million cases) and evening hours (2.3 million cases). The morning (1.4 million) and night (1.2 million) periods show relatively lower activity.
These observations suggest that crimes are closely tied to human activity and visibility during the day.

4. Crime Categories

- **Most Common Offences:** Theft emerges as the most frequent crime, followed by Battery, Narcotics, Assault, Burglary, and Motor Vehicle theft.
- **Arrest Distribution:** Narcotics-related crimes have comparatively higher arrest rates, while property crimes such as theft and burglary dominate in volume but result in fewer arrests.
Implications: Property crimes tend to be harder to solve or trace to offenders, while drug-related offences often involve proactive enforcement actions that yield more arrests.

5. Geographic Hotspots

- **District Distribution:** Districts 002, 003, 004, and 006 consistently record the highest crime volumes. In contrast, Districts 001 and 005 remain relatively lower but still show fluctuations.
- **Persistent Hotspots:** Central and densely populated areas continue to experience the most criminal activity, pointing to urban crime concentration.
Crime Type Distribution: Theft is widespread across all districts, while narcotics-related crimes appear more localized, indicating concentrated criminal networks in certain areas.

6. Arrests and Domestic Crimes

- **Overall Arrest Rates:** Arrests remain below one-third of all recorded crimes throughout the observed period.
- **Category-Specific Trends:** Violent crimes such as assault, alongside narcotics offences, are more likely to lead to arrests compared to property crimes.
- **Domestic and Community Impact:** A significant proportion of assault and battery incidents are linked to domestic or interpersonal conflicts. This highlights the importance of community-based interventions alongside law enforcement responses.

7. Key Notes

1. **Police strict focus:** Districts 002, 003, 004, and 006 should remain priorities for policing and resource deployment.
2. **Crime Prevention:** Preventive measures for theft and burglary need to be strengthened, as they are the most common but least resolved offences. Enhanced patrols during afternoon and evening periods may help reduce incidents.
3. **Community Support:** Addressing domestic violence and interpersonal disputes requires not only police response but also awareness campaigns, social services, and victim support programs.
4. **Arrest Challenges:** The 26% arrest rate suggests a need for improved investigative tools, surveillance technology, and stronger community-police collaboration.
5. **Encouraging Trends:** The steady decline in total crimes since 2005 indicates that existing measures have had a positive effect, though continued focus is necessary to sustain progress and address evolving hotspots.
